

Physiology contribution: Δ AUC vs backbone-only across three protocols
Representation-dependent marginal value — practical-significance threshold (± 0.005 AUC) shown in red

CLIP under strict LODO (E14, no leak): full_fusion $\Delta = -0.005$ AUC (Stouffer-combined $p = 0.029$ in favour of backbone-only across 5 seeds, $n = 1758$) — physiology slightly harmful under true cross-dataset evaluation.
